## Supporting Information

## Synthetic Procedures and Compound Characterization Data

## LC-MS Methods:

Samples were run on an Agilent model-1100 LC-MSD system with an Agilent Technologies SB-C18 (3.0 $\mu \mathrm{M}$ ) reverse phase column ( $3.0 \times 50 \mathrm{~mm}$ ) at $40^{\circ} \mathrm{C}$. The flow rate was constant at $1.5 \mathrm{~mL} / \mathrm{min}$. The mobile phase used a mixture of solvent $\mathrm{A}\left(\mathrm{H}_{2} \mathrm{O} / 0.1 \% \mathrm{TFA}\right)$ and solvent $\mathrm{B}(\mathrm{MeCN} / 0.1 \% \mathrm{TFA})$ with a 3.6 min time period for a gradient from $5 \%$ to $95 \%$ solvent B. The gradient was followed by a 0.5 min period to return to $5 \%$ solvent B and a 2.5 min $5 \%$ solvent B re-equilibration (flush) of the column. Integrated HPLC purities are reported at 215 nM .

## NMR Spectra:

All NMR spectra were run on a Varian (Varian, Palo Alto, CA) series Mercury 300 MHz instrument or a Bruker (Bruker, Bilerica, MA) series 400 MHz instrument. Where so characterized, all observed protons are reported as parts-per-million (ppm) downfield from tetramethylsilane (TMS) or other internal reference in the appropriate solvent indicated.

## 6-Methylisoquinoline (5)

Aminoacetaldehyde dimethyl acetal ( $8.83 \mathrm{~mL}, 81.1 \mathrm{mmol}$ ) was added over 1 min to a stirred solution of ptolualdehyde ( $9.88 \mathrm{~mL}, 81.1 \mathrm{mmol}$ ) in chloroform $(150 \mathrm{~mL})$ at $22^{\circ} \mathrm{C}$. An exotherm was noted. The reaction was heated to reflux $\left(65^{\circ} \mathrm{C}\right)$ and half the solvent was removed (to remove water). The heat was removed and the yellow solution was cooled to r.t. NMR showed the imine was formed smoothly, however, a trace of aldehyde could be observed. The yellow solution was diluted with chloroform to bring the volume back to $\sim 100 \mathrm{~mL}$, cooled to $-3^{\circ} \mathrm{C}$ and ethyl chloroformate $(7.99 \mathrm{~mL}, 81.1 \mathrm{mmol})$ was added dropwise over 5 min followed by triethyl phosphite ( $17.4 \mathrm{~mL}, 97.3 \mathrm{mmol}$ ) over 10 minutes. The clear yellow solution was then allowed to warm to room temperature. A reflux condenser added to reaction vessel. After 23 h , titanium tetrachloride ( $35.6 \mathrm{~mL}, 324 \mathrm{mmol}$ ) was added very slowly (strong exotherm and white fumes observed) and the reaction began to gently reflux $\left(50^{\circ} \mathrm{C}\right)$. Color changed from yellow to dark red to dark brown. Once addition was complete, the dark brown solution was heated to reflux $\left(52^{\circ} \mathrm{C}\right)$ for 10.5 h . After allowing to cool to room temperature overnight, the dark brown solution was poured onto ice (filled a 2 L beaker with approximately 1 L of ice), the organic layer was separated off, and the aqueous layer was washed with dichloromethane ( $2 \times 100 \mathrm{~mL}$ ). The aqueous layer (now orange in color) was poured into a solution of potassium sodium tartrate tetrahydrate ( $183 \mathrm{~g}, 648 \mathrm{mmol}$ ) in water $(300 \mathrm{~mL})$, basified to
pH 9 with 28-30 \% ammonium hydroxide (a white ppt crashed out) and then extracted with dichloromethane (3x 200 mL ). The organic layer was separated, dried over sodium sulfate, filtered and the solvent was evaporated in vacuo to yield 6-methylisoquinoline ( $9.02 \mathrm{~g}, 78 \%$ yield) as a light tan amorphous solid. MS (ESI, pos. ion) m/z: $144.1[\mathrm{M}+\mathrm{H}]^{+} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 2.56(\mathrm{~s}, 3 \mathrm{H}) 7.44(\mathrm{dd}, \mathrm{J}=8.31,1.27 \mathrm{~Hz}, 1 \mathrm{H}) 7.57(\mathrm{~d}, \mathrm{~J}=5.87 \mathrm{~Hz}, 1$ H) $7.60(\mathrm{~s}, 1 \mathrm{H}) 7.87(\mathrm{~d}, \mathrm{~J}=8.22 \mathrm{~Hz}, 1 \mathrm{H}) 8.48(\mathrm{~d}, \mathrm{~J}=5.67 \mathrm{~Hz}, 1 \mathrm{H}) 9.19(\mathrm{~s}, 1 \mathrm{H})$.

The reaction was poured onto crushed ice and basified with 5 N NaOH . The solid that precipitated was collected by suction filtration, washed with water and dried to give the product ( $2.5 \mathrm{~g}, 95 \%$ ) as a tan solid. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 2.60(\mathrm{~s}, 3 \mathrm{H}), 7.54(\mathrm{~d}, \mathrm{~J}=8.03 \mathrm{~Hz}, 1 \mathrm{H}), 7.60(\mathrm{~d}$, $\mathrm{J}=6.02 \mathrm{~Hz}, 1 \mathrm{H}), 8.06(\mathrm{~d}, \mathrm{~J}=8.03 \mathrm{~Hz}, 1 \mathrm{H}), 8.66(\mathrm{~d}, \mathrm{~J}=6.02 \mathrm{~Hz}, 1 \mathrm{H}), 9.30(\mathrm{~s}, 1 \mathrm{H})$.

## 6-Chloro-9-(tetrahydro-2H-pyran-2-yl)-9H-purine (22)

A suspension of 6-chloro-9H-purine ( $25.36 \mathrm{~g}, 164 \mathrm{mmol}$ ) (Alfa Aesar) and 4-methylbenzenesulfonic acid ( 0.565 g , 3.28 mmol ) in EtOAc ( 250 mL ) was treated with 3,4-dihydro-2H-pyran ( $44.9 \mathrm{~mL}, 492 \mathrm{mmol}$ ). The mixture was heated at $90^{\circ} \mathrm{C}$ and the solid slowly dissolved over 1 h . The flask was removed from the oil bath and the cloudy yellow solution was filtered and concentrated in vacuo.

The pale yellow residue was dissolved in DCM and purified by flash chromatography ( $50 \% \mathrm{EtOAc} /$ hexane) (1 L silica / 4 L solvent) to give 6-chloro-9-(tetrahydro-2H-pyran-2-yl)-9H-purine ( $38.90 \mathrm{~g}, 99 \%$ yield) as a colorless oil which slowly crystallized. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , d6-DMSO) $\delta 8.91(\mathrm{~s}, 1 \mathrm{H}), 8.82(\mathrm{~s}, 1 \mathrm{H}), 5.80(\mathrm{~d}, 1 \mathrm{H}), 4.04(\mathrm{~m}, 1$ H), $3.75(\mathrm{~m}, 1 \mathrm{H}), 2.35(\mathrm{~m}, 1 \mathrm{H}), 2.01(\mathrm{~m}, 2 \mathrm{H}), 1.76(\mathrm{~m}, 1 \mathrm{H}), 1.62(\mathrm{~m}, 2 \mathrm{H})$.

## 6-(2-Fluoropyridin-3-yl)-9-(tetrahydro-2H-pyran-2-yl)-9H-purine (23)

A solution of 6-chloro-9-(tetrahydro-2H-pyran-2-yl)-9H-purine ( $33.06 \mathrm{~g}, 139 \mathrm{mmol}$ ) in ethanol ( 560 mL ) was sequentially treated with water ( 80 mL ), 2-fluoropyridin-3-ylboronic acid ( $25.4 \mathrm{~g}, 180 \mathrm{mmol}$ ), potassium acetate ( $29.9 \mathrm{~g}, 305 \mathrm{mmol}$ ) and bis(di-tert-butyl-(4-dimethylaminophenyl)phosphine)dichloropalladium(II) (APhos) ( $1.47 \mathrm{~g}, 2.1 \mathrm{mmol})$. The aqueous layer was extracted with EtOAc ( 200 mL ) and the combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered through celite, and concentrated. The crude product was dissolved in a minimum volume of DCM and purified by flash chromatography ( $50 \%->75 \%->100 \% \mathrm{EtOAc} /$ hexane ) to give 6-(2-fluoropyridin-3-yl)-9-(tetrahydro-2H-pyran-2-yl)-9H-purine ( $40.0 \mathrm{~g}, 96 \%$ yield) as an off-white solid. ${ }^{1} \mathrm{H}$ NMR (400 MHz, d6-DMSO) $\delta 9.11(\mathrm{~s}, 1 \mathrm{H}), 8.91$ ( $\mathrm{s}, 1 \mathrm{H}), 8.58(\mathrm{~m}, 1 \mathrm{H}), 8.49(\mathrm{~s}, 1 \mathrm{H}), 7.62(\mathrm{~m}, 1 \mathrm{H}), 5.85(\mathrm{~d}, 1$ H), $4.05(\mathrm{~m}, 1 \mathrm{H}), 3.75(\mathrm{~m}, 1 \mathrm{H}), 2.38(\mathrm{~m}, 1 \mathrm{H}), 2.05(\mathrm{~m}, 2 \mathrm{H}), 1.79(\mathrm{~m}, 1 \mathrm{H}), 1.61(\mathrm{~m}, 2 \mathrm{H})$.

6-(2-fluoropyridin-3-yl)-9-(tetrahydro-2H-pyran-2-yl)-9H-purine ( $3.273 \mathrm{~g}, 10.94 \mathrm{mmol}$ ) and N1-(4-chlorophenyl)-6-methylisoquinoline-1,5-diamine ( $3.103 \mathrm{~g}, 10.94 \mathrm{mmol}$ ) were dissolved in anhydrous THF ( 30 mL ) under nitrogen. [Gentle heating was applied with a heat gun to aid dissolution]. The deep red solution was cooled in an ice/water bath and treated dropwise with LiHMDS ( 55 mL of a 1.0 M solution in THF, 5 equiv.). Co-Crystal Structure Determination of B-Raf with Compound 1. B-Raf(433-726)V600E with an Nterminal $\mathrm{His}_{6}$ affinity tag, $\mathrm{His}_{6} \mathrm{~B}-\mathrm{Raf}$, and the co-chaperone p 50 Cdc 37 were cloned into the pFASTBac Dual vector (Invitrogen) and co-expressed by baculovirus-mediated infection of insect cells (Hi-5; Invitrogen), essentially as described. ${ }^{2}$ The protein was purified by immobilized metal affinity chromatography on Ni-NTA Superflow (Qiagen, Inc.), followed by cation exchange chromatography on Source 15S (GE Healthcare Life Sciences). 0.2 M NDSB-256 was included in buffers for the final column to minimize protein aggregation and precipitation. Purified protein was concentrated to $\sim 2 \mathrm{mg} / \mathrm{ml}$ using an Ultrafree- 0.5 concentrator (Millipore) and compound 1 was added to a concentration of 0.4 mM . Crystals were grown at room temperature by vapor diffusion in hanging drops consisting of $0.8 \mu \mathrm{~L}$ of protein solution mixed with an equal volume of well solution ( $17 \%$ (w/v) PEG $8000,75 \mathrm{mM}$ sodium succinate, 0.1 M Tris, pH 8.6 ). For data collection, crystals were transferred sequentially into mother liquor containing 5-30\% ethylene glycol before flash-cooling in liquid nitrogen. X-ray diffraction data were collected at beamline 5.0.2 of the Advanced Light Source at Lawrence Berkeley National Laboratories using an ADSC Quantum 315 detector and $\lambda=1.000 \AA$. Data were indexed and scaled using the HKL suite of programs. ${ }^{3}$ B-Raf crystals belonged to space group $\mathrm{P} 4_{1} 2_{1} 2$ with two molecules per asymmetric unit. Unit cell dimensions were $\mathrm{a}=\mathrm{b}=93.5 \AA$ and $\mathrm{c}=166.7 \AA$. Data collection statistics appear in Table S1.

The structure was solved by molecular replacement using EPMR ${ }^{4}$ and the coordinates of wild-type B-Raf + sorafenib (PDB code 1UWH) as a search model. ${ }^{2}$ Refinements were performed with REFMAC5 ${ }^{5}$ as implemented in CCP4 ${ }^{6}$ and model building was done with COOT. ${ }^{7}$ The final model contained two protein molecules, two inhibitor molecules, and 79 water molecules and had good geometry with $89.6 \%$ and $9.9 \%$ of the residues located in the most favored and additionally allowed regions of the Ramachandran plot, respectively. Data refinement statistics appear in Table S1.

## Efficacy studies using A375 SQ2 xenograft model:

The A375 SQ2 cell line was generated by performing two serial in vivo passages in CD1 nude mice to optimize for tumor take and growth. All Raf inhibitors were formulated in $2 \%$ HPMC, $1 \%$ Tween 80, pH 2.2. Formulation alone was used to dose animals in vehicle groups. Five million cells suspended in Matrigel (BD Bioscience) were injected subcutaneously in each CD1 nu/nu female mouse (0.2 $\mathrm{mL} /$ mouse). When tumor volume reached approximately $200 \mathrm{~mm}^{3}$, mice were randomized into groups ( $\mathrm{n}=10$ ) and treatment started. Dosing occurred orally (PO), once (QD) or twice daily (BID) every day at the dose indicated in milligram per kilogram ( $\mathrm{mg} / \mathrm{kg}$ ) and lasted for the duration of the experiment (14 days dosing). Tumor volume and body weight were measured in a blinded fashion twice per week using calipers and an animal scale, respectively. $\mathrm{ED}_{50}$ values were calculated from the linear regression of the percent tumor inhibition on the last day of the experiment versus the dose of compound used using GraphPad Prism 5.1 software.
