## Experimental Section

General Experimental Procedures. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AMX-500, AV-400, and AM400 spectrometers. ${ }^{1} \mathrm{H}$ chemical shifts are referenced to the residual $\mathrm{DMSO}-\mathrm{d}_{6}$ and $\mathrm{CDCl}_{3}$ signals ( $\delta 2.49$ and 7.24 ppm ) and ${ }^{13} \mathrm{C}$ chemical shifts are referenced to the $\mathrm{DMSO}-\mathrm{d}_{6}$ and $\mathrm{CDCl}_{3}$ solvent peaks ( $\delta 39.5$ and 77.0 ppm ). Low and high resolution EIMS were recorded on Kratos AEI MS-59 and AEI MS-50 mass spectrometers, and low and high resolution ESI-QIT-MS were recorded on a Bruker-Hewlett Packard 1100 Esquire-LC system mass spectrometer. UV spectra were recorded with a Waters 2487 Dual $\lambda$ Absorbance Detector. Optical rotations were measured using a Jasco P-1010 Polarimeter with sodium light ( 589 nm ).

Merck Type 5554 silica gel plates and Whatman MKC18F plates were used for analytical thin layer chromatography. Waters Sep-Pak’s or Merck silica gel G60 (230-400 mesh) were used for silica gel chromatograhpy. Reversed-phase HPLC purifications were performed on a Waters 600E System Controller liquid chromatography attached to a Waters 996 Photodiode Array Detector. All solvents used for HPLC were Fisher HPLC grade.

Isolation of liphagal (1): Specimens of Aka coralliphaga (Demospongiae, order Haplosclerida, family Phloeodictyidae) were collected by hand using SCUBA at a depth of 20 m on reefs in Prince Rupert Bay, 4 Km south of Portsmouth, Dominica in June 1997. Freshly collected sponge was frozen on site and transported frozen to Vancouver. A voucher sample of Aka coralliphaga has been deposited at the University of Amsterdam (ZM 17866).

A sample of sponge ( 300 g ) was cut into small pieces, immersed in and subsequently extracted repeatedly with $\mathrm{MeOH}(4 \times 400 \mathrm{~mL})$ at room temperature. The combined methanolic extracts were concentrated in vacuo and the resultant brown gum was partitioned between EtOAc ( $4 \times 50 \mathrm{~mL}$ ) and $\mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$. The $\mathrm{H}_{2} \mathrm{O}$ extract exhibited PI3K inhibitory activity and was further extracted with $\mathrm{BuOH}(4 \times 50 \mathrm{~mL}$ ). The combined BuOH extracts were evaporated to dryness, to give 265 mg of brown oil, that was chromatographed on a Sephadex LH-20 column eluting with MeOH to give a fraction ( 143.7 mg ) exhibiting PI3K inhibitory
activity. Pure liphagal (1) ( 5.6 mg ) was obtained from this mixture via $\mathrm{C}_{18}$ reversed-phase HPLC using a CSCInertsil 150A/ODS2, $5 \mu \mathrm{~m} 25 \times 0.94 \mathrm{~cm}$ column, eluting with $17: 3 \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$.

Liphagal (1): Isolated as a yellow amorphous solid; $[\alpha]^{25}{ }_{\mathrm{D}}+12.0^{\circ}$ (c 3.7, MeOH); UV (MeOH) $\lambda_{\text {max }} 197$ ( $\varepsilon$ 28,600), 240 ( $\varepsilon 10,900$ ), $313(\varepsilon 7,100), 385(\varepsilon 2,700) \mathrm{nm} ;{ }^{1} \mathrm{H}$ NMR, see Table $1 ;{ }^{13} \mathrm{C}$ NMR, see Table 1; HREIMS [M] ${ }^{+} \mathrm{m} / \mathrm{z} 356.19944$ (calcd for $\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{O}_{4}, 356.19876$ ).

## Synthesis of liphagal.

Preparation of Compound 8. To a solution of 2,4,5-trimethoxybenzaldehyde (7) ( $3.92 \mathrm{~g}, 20 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $\mathrm{BBr}_{3}\left(1,0 \mathrm{M}\right.$ in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}, 20 \mathrm{mmol}\right)$. The organic phase was dried over $\mathrm{MgSO}_{4}$, filtered, and evaporated under reduced pressure. Chromatography of the residue on silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ afforded the phenol (3.2 g) in $87 \%$ yield. Bromine ( $0.8 \mathrm{~mL}, 15.3 \mathrm{mmol}$ ) was added at rt to a solution of the phenol ( $2.76 \mathrm{~g}, 15.2 \mathrm{mmol}$ ) and NaOAc (1.9 g, 23 mmol ) in $\mathrm{AcOH}(100 \mathrm{~mL}$ ). The resulting yellow solution was stirred for 2 h . The solvent was removed under vacuum and the residue was poured into an aqueous solution of $\mathrm{NaHCO}_{3}$. The aqueous phase was extracted with EtOAc. The combined EtOAc layers were dried over $\mathrm{MgSO}_{4}$, filtered, and evaporated under reduced pressure. Method A: To a solution of benzofuran 16 ( $200 \mathrm{mg}, 0.45$ mmol ) in cyclohexane ( 5 mL ) was added anhydrous formic acid ( 2 mL ) and the resulting biphasic mixture was refluxed for 1 month. After cooling to rt, the organic phase was separated and evaporated under reduced pressure. Chromatography of the residue on silica gel (1:99 EtOAc/hexanes) afforded the tetracyclic compound 18 (white solid, 79 mg ) as an equimolar mixture of 2 diastereomers in $40 \%$ yield.

Method B: To a solution of benzofuran $16(218 \mathrm{mg}, 0.5 \mathrm{mmol})$ in nitropropane ( 25 mL ), at $-78^{\circ} \mathrm{C}$, was added chlorosulfonic acid ( $0.27 \mathrm{~mL}, 2 \mathrm{mmol}$ ). The resulting mixture was allowed to stir at $-78^{\circ} \mathrm{C}$ for 30 min . An aqueous solution of $\mathrm{NaHCO}_{3}$ was then added and the aqueous phase was extracted with EtOAc. The EtOAc phase was dried over $\mathrm{MgSO}_{4}$, filtered, and evaporated under reduced pressure. Chromatography of the residue on silica gel (3:97 EtOAc/hexanes) afforded the tetracyclic compound 18 ( 93 mg ) as a mixture of 2 diastereomers in $43 \%$ yield with a $5 / 2$ diastereomeric ratio of 18b/18a.

Preparation of Compounds 19a and 19b. To a solution of bromobenzofuran 18 (130 mg, 0.3 mmol ) in THF ( 20 mL ) at $-78^{\circ} \mathrm{C}$ was added $n$ - $\mathrm{BuLi}(1.6 \mathrm{M}$ in Hexanes, $0.21 \mathrm{~mL}, 0.33 \mathrm{mmol}$ ). After stirring at this temperature for 30 min DMF ( $0.23 \mathrm{~mL}, 3.0 \mathrm{mmol}$ ) was added. The mixture was stirred for 1 h and then warmed to rt. Aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added and the aqueous phase was extracted with EtOAc. The EtOAc phase was dried over $\mathrm{MgSO}_{4}$, filtered, and evaporated under reduced pressure. Chromatography of the residue on silica gel (3:97

EtOAc/hexanes) afforded the aldehyde $19(87 \mathrm{mg})$ in 76 \% yield. The two diastereomers 19a and 19b were separated by HPLC using a Whatman Magnum-9 Partisil 10 column with 1:19 EtOAc/hexanes as the eluent.

## Experimental

## Data Collection

A colourless tablet crystal of $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{4}$ having approximate dimensions of $0.50 \times 0.35 \times 0.10 \mathrm{~mm}$ was mounted on a glass fiber. All measurements were made on a Bruker X8 APEX diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K} \alpha$ radiation.

The data were collected at a temperature of $-100.0 \pm 0.1^{\circ} \mathrm{C}$ to a maximum $2 \theta$ value of $55.9^{\circ}$. Data were collected in a series of $\phi$ and $\omega$ scans in $0.50^{\circ}$ oscillations with 10.0 second exposures. The crystal-to-detector distance was 38.02 mm .

## Data Reduction

Of the 35886 reflections that were collected, 4872 were unique ( $\mathrm{R}_{\mathrm{int}}=0.035$ ); equivalent reflections were merged. Data were collected and integrated using the Bruker SAINT ${ }^{1}$ software package. The linear absorption coefficient, $\mu$, for Mo-K $\alpha$ radiation is $0.84 \mathrm{~cm}^{-1}$. Data were corrected for absorption effects using the multi-scan technique (SADABS ${ }^{2}$ ), with minimum and maximum transmission coefficients of 0.901 and 0.992 , respectively. The data were corrected for Lorentz and polarization effects.

## Structure Solution and Refinement

The structure was solved by direct methods ${ }^{3}$. All non-hydrogen atoms were refined anisotropically. All hydrogen atoms were included in calculated positions but not refined. The final cycle of full-matrix leastsquares refinement ${ }^{4}$ on $\mathrm{F}^{2}$ was based on 4872 reflections and 259 variable parameters and converged (largest parameter shift was 0.00 times its esd) with unweighted and weighted agreement factors of:

$$
\begin{gathered}
\mathrm{R} 1=\Sigma| | \mathrm{Fo}|-|\mathrm{Fc} \| / \Sigma| \mathrm{Fo}|=0.081 \\
\mathrm{wR} 2=\left[\Sigma\left(\mathrm{w}\left(\mathrm{Fo}^{2}-\mathrm{Fc}^{2}\right)^{2}\right) / \Sigma \mathrm{w}\left(\mathrm{Fo}^{2}\right)^{2}\right]^{1 / 2}=0.161
\end{gathered}
$$

The standard deviation of an observation of unit weight ${ }^{5}$ was 1.08 . The weighting scheme was based on counting statistics. The maximum and minimum peaks on the final difference Fourier map corresponded to 0.34 and $-0.19 \mathrm{e}^{-} / \AA^{3}$, respectively.

Neutral atom scattering factors were taken from Cromer and Waber ${ }^{6}$. Anomalous dispersion effects were included in Fcalc ${ }^{7}$; the values for $\Delta f^{\prime}$ and $\Delta f^{\prime \prime}$ were those of Creagh and McAuley ${ }^{8}$. The values for the mass attenuation coefficients are those of Creagh and Hubbell ${ }^{9}$. All refinements were performed using the SHELXTL ${ }^{10}$ crystallographic software package of Bruker-AXS.
